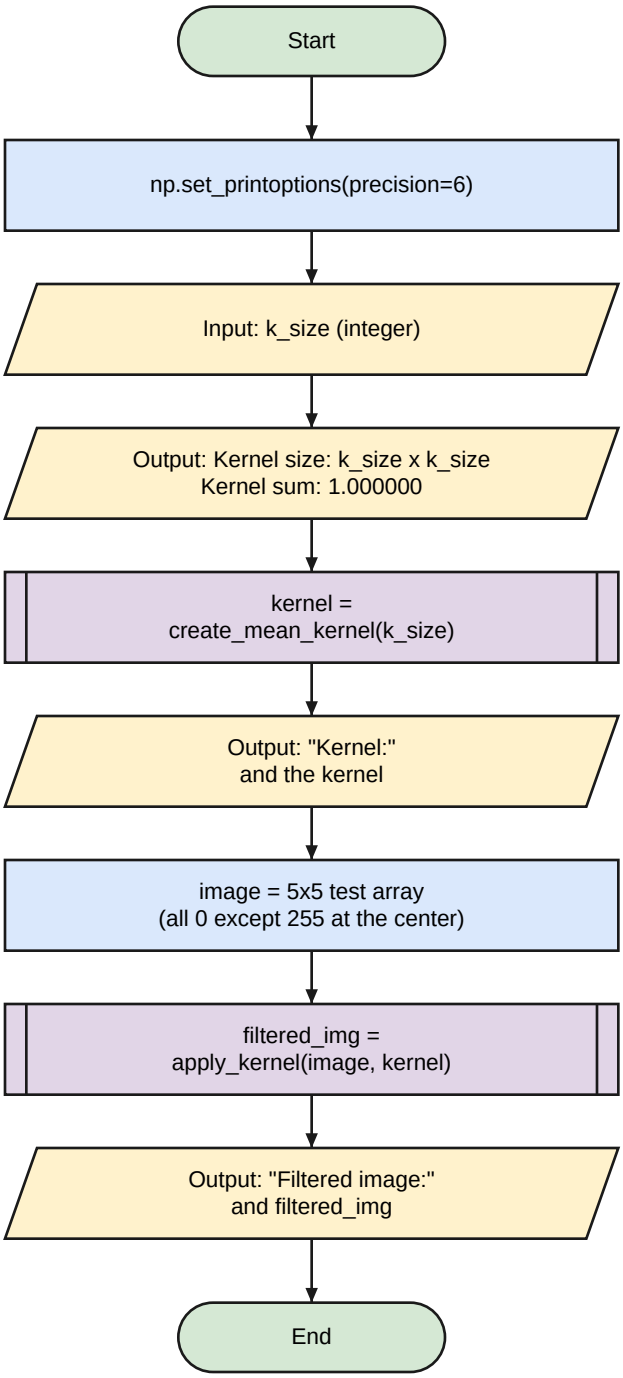
Mean Blur - main()

Builds a mean kernel and applies it to a 5x5 test image



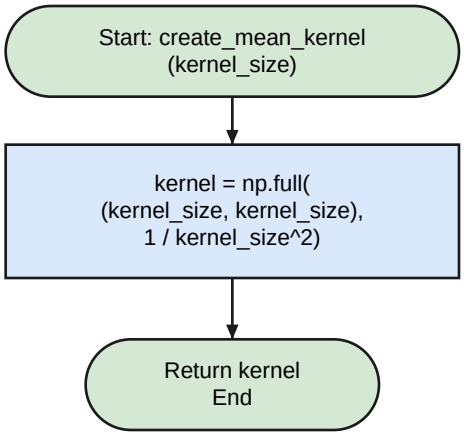
(see p. 2)

(see p. 3)

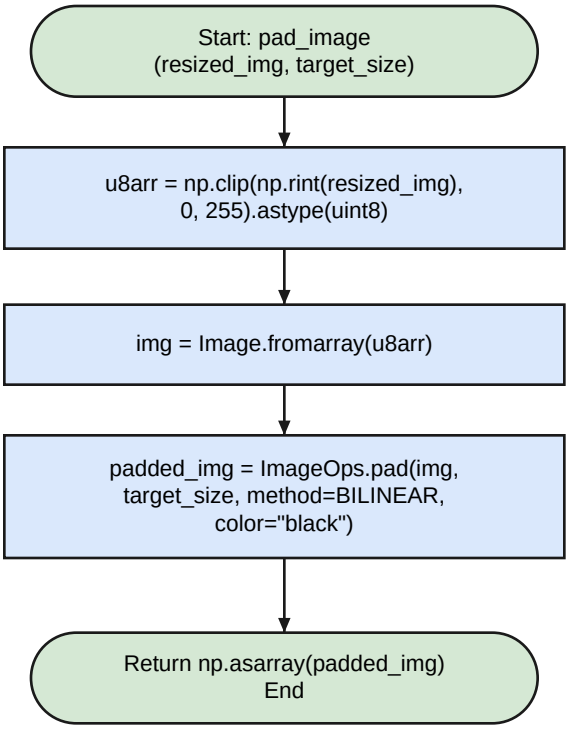
The "Kernel sum: 1.000000" line is fixed text; it is not computed from the kernel.

create_mean_kernel(kernel_size) and pad_image(resized_img, target_size)

Building the kernel, and padding the image with black

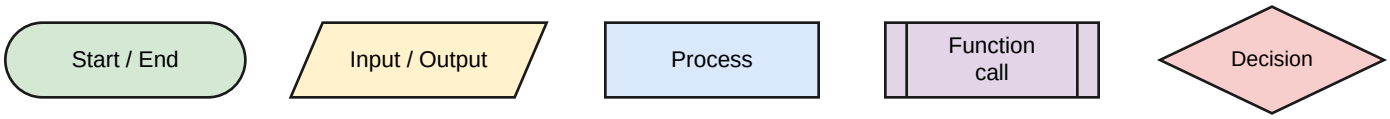


Every entry is equal, so the kernel sums to 1 (a mean / box blur).



The image is centered on a black canvas of target_size.

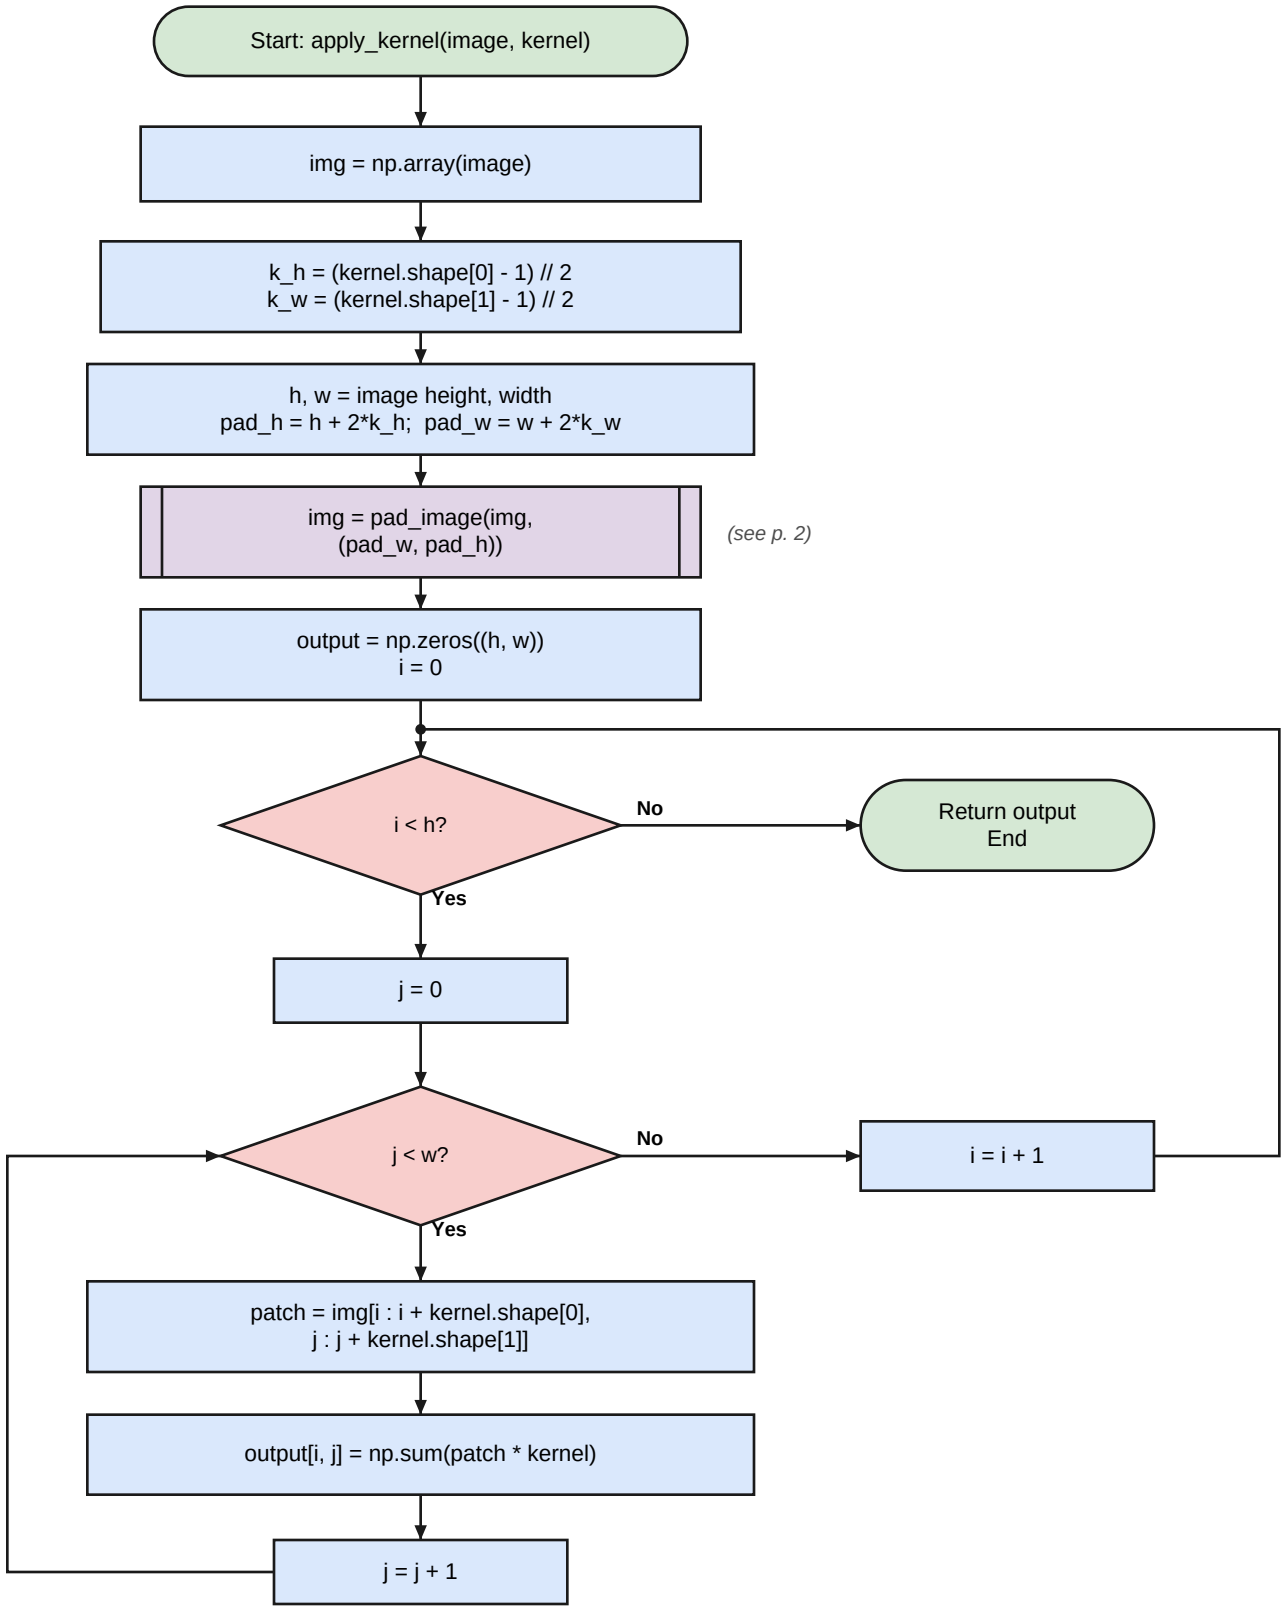
Legend



Arrows show the direction of flow. Predefined-process boxes (double side bars) are expanded on later pages.

apply_kernel(image, kernel)

Pads the image, then slides the kernel over it with stride 1



Padding adds k_h rows and k_w columns on each side, so output has the same size as the input.
Assumes an odd kernel size: with an even size the padding is too small and the patch no longer matches the kernel near the edges.
